**VERSION 1.1.19 OCTOBER 23, 2024** 

-

## In this update ...

## 

🖵 WEB

## **Custom Excel Reports**

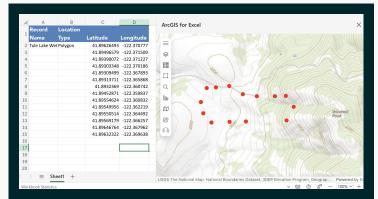

We're excited to introduce the highly anticipated **Custom Excel Reports** feature! This new functionality brings all the powerful relational and recursive reporting capabilities you've come to expect from our .docx reports, but with the added flexibility of Excel. Now, you can tailor your data exports with full control over formatting, organization, and media integration. This means you can not only structure your data but also include embedded images, giving you even more ways to customize your reports to fit your needs.

## **Unlocking powerful Excel tools**

With Custom Excel Reports, you can unlock Excel's powerful functions, such as conditional formatting and pivot tables, and leverage thirdparty add-ins to enhance your workflow.

| Record Name                    | Archetype |
|--------------------------------|-----------|
| Tule Lake Wetlands             | Area      |
| _Wetland Marshland             | Resource  |
| Tule Wetlands District         | District  |
| Tule Village Site              | Site CA   |
| Fish Drying Hut                | Building  |
| Stone Mortar                   | Object    |
| _Migratory Bird Nesting Ground | Resource  |
| Avian Sanctuary District       | District  |
| Native Campground Site         | Site CA   |
| Bird Observation Tower         | Building  |

Built-in tools like conditional formatting allow you to easily categorize and highlight data based on your custom criteria, making it simpler to spot patterns and key information at a glance.

Visualize data in new ways, such as with ESRI's ArcGIS for Excel add-in, enabling seamless geospatial analysis directly within your spreadsheets.

## Let's make this feature even better!

We've packed a lot of new functionality into Custom Excel Reports, but we want to hear from you. How can Excel reports better support your work? Let us know how we can continue to expand and improve this feature to meet your needs.

## Project area boundary style is changed

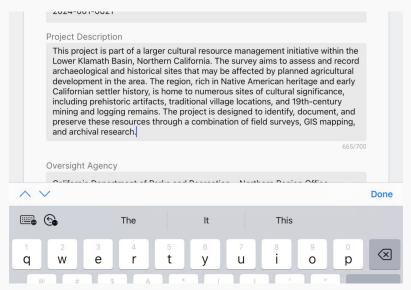

We've updated the visual representation of project area boundaries in the mobile app to align with the web styling, ensuring a consistent experience across platforms. This change improves clarity, especially when viewing multiple overlapping boundaries.

## Added // buttons above keyboard to navigate between text fields.

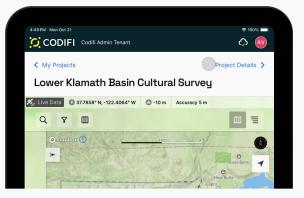

We've introduced new buttons on mobile that appear above the keyboard, allowing users to easily navigate between text fields without needing to close the keyboard. This feature enhances the flow when entering data, making it quicker to complete forms or records.

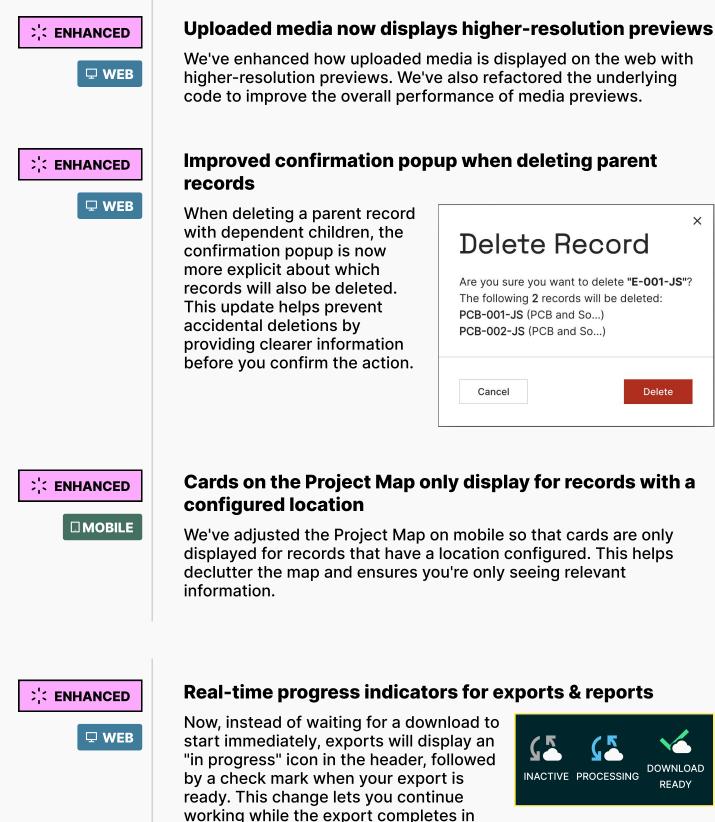

### **Project Details Moved**

We've streamlined the UI for navigating to project details in the mobile app, making it more intuitive and accessible. This change simplifies the workflow, helping you find and view project information faster with fewer taps.

### Continuous auto-numbering by record type

We've updated the auto-numbering system to generate continuous numbers for each record type, regardless of parent-child relationships. This eliminates the need for teams to manually coordinate numbering, making it easier to stay in sync across the project.

FIXED

**BACKEND** 

Improved the backend of the reports feature for reliable performance

We've made updates to the backend of the reports feature to resolve issues that caused report generation to fail in certain cases. This enhancement ensures more reliable and consistent performance, even for larger reports.

## Fixed an issue where project dates couldn't be entered via keyboard

We resolved a bug that prevented users from inputting project dates using their keyboard. You can now seamlessly enter dates without needing to rely on the date picker.

### "Reset password" link navigated to the wrong URL

We fixed an issue where the "Reset password" link in the mobile app would direct users to the wrong URL. It now correctly takes you to the intended reset page.

## What's next?

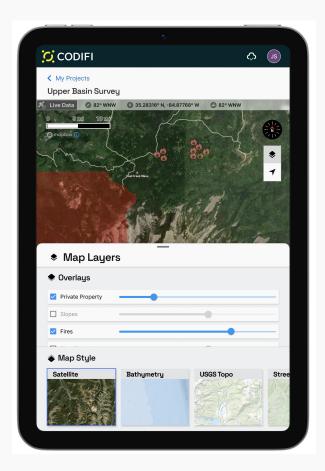

### Known issue: Repeater tables don't automatically refresh

Repeater tables currently do not automatically refresh when entries are added or deleted. The changes are saved, but you'll need to manually refresh the page or navigate away and back to see the updates. We're actively working on a fix for this.

### **Custom map styles and data layers**

We're working on a feature that will allow users to import custom data layers into their projects. On mobile, you'll be able to toggle the visibility of these layers, adjust their transparency, and apply custom map styles, giving you more control over how your data is visualized in the field.

### Codifi Publish Notes v1.1.19
